Project Overview

WhatNext Vision Motors uses a Salesforce CRM solution to bring important automotive activities into one system. The project manages vehicle information, vehicle stock, dealer information, customer information, vehicle orders, test-drive bookings, and service requests.

The CRM also supports useful automation. Vehicle stock is checked during order processing, dealer assignment can be automated using customer information, test-drive reminders can be sent to customers, and pending orders can be processed using Batch Apex when stock becomes available. This helps reduce repeated manual work and gives users a clearer view of the business process.

The project combines Salesforce configuration and development features including custom objects, fields, lookup relationships, Record-Triggered Flows, Apex Trigger, Trigger Handler, Batch Apex, Scheduled Apex, Lightning configuration, reports, and dashboards.

Key Features

- Centralized vehicle, dealer, customer, order, test-drive, and service information.
- Vehicle stock and availability management.
- Customer-to-vehicle and customer-to-order relationships.
- Automated dealer assignment for vehicle orders.
- Automated test-drive reminder communication.
- Stock validation and stock update logic using Apex.
- Batch processing for suitable pending orders.
- Lightning-based user interface and business reports.

Objectives

The main objective of the project is to build a simple and useful automotive CRM that improves the way vehicle, customer, dealer, order, test-drive, and service information is maintained. The system aims to reduce manual activities, improve data accuracy, support faster order processing, and provide better visibility for users.

The project objectives are:

- Manage vehicle details, prices, status, and stock quantity.
- Maintain authorized dealer and customer information.
- Track vehicle orders and their status.
- Manage test-drive bookings and service requests.
- Prevent orders when a selected vehicle has no available stock.
- Support automatic dealer assignment based on customer information.
- Send reminders for scheduled test drives.
- Process suitable pending orders when stock becomes available.
- Reduce repetitive administrative work.
- Provide useful reports and dashboards for business visibility.

Chapter 1

Phase 1: Requirement Analysis & Planning

1.1 Understanding Business Requirements

The requirements were considered from the point of view of an automotive business that needs one place to maintain vehicle and customer information. The main needs identified were centralized data, reliable stock information, easier dealer assignment, order tracking, test-drive management, service-request tracking, and better visibility of business information.

The Salesforce solution addresses these needs through related custom objects and automation. Instead of keeping the information separately, the records are connected through lookup relationships so that an order, test drive, or service request can be associated with the correct customer and vehicle.

1.2 Defining Project Scope and Objectives

The project scope includes:

- Custom Salesforce objects and fields.
- Lookup relationships between related business records.
- Vehicle stock and order processing.
- Record-Triggered Flow automation.
- Apex Trigger and Trigger Handler.
- Batch Apex and Scheduled Apex.
- Lightning application and pages.
- User access and security configuration.
- Reports and dashboards.
- Testing of the implemented business functions.

1.3 Data Model Design

The CRM uses six custom objects.

Object	Purpose	Main Relationships
Vehicle__c	Stores vehicle details, price, status, and stock quantity.	Vehicle Dealer, Vehicle Order, Test Drive, Service Request
Vehicle_Dealer__c	Stores authorized dealer information.	Vehicle and order-related processing
Vehicle_Customer__c	Stores customer contact and preference information.	Vehicle Order, Test Drive, Service Request
Vehicle_Order__c	Tracks vehicle purchase orders.	Vehicle, Customer
Vehicle_Test_Drive__c	Tracks customer test-drive bookings.	Vehicle, Customer
Vehicle_Service_Request__c	Records vehicle service requests.	Vehicle, Customer

1.4 Security Model Design

The planned security model uses Salesforce profiles, roles, role hierarchy, permission sets, object permissions, field-level access, and sharing configuration. The purpose is to provide users with the access needed for their responsibilities while keeping business information appropriately controlled.

Chapter 2

Phase 2: Salesforce Development – Backend & Configurations

2.1 Setup Environment & Development Workflow

The project was configured in a Salesforce development environment using Salesforce Setup and Object Manager. The general workflow followed requirement analysis, data model planning, object and field configuration, automation development, Apex development, user-interface configuration, testing, and maintenance.

The screenshot shows the Salesforce Object Manager interface. At the top, there's a search bar with 'vehicle' entered. Below the search bar, a table lists six custom objects. The table has columns for LABEL, API NAME, TYPE, DESCRIPTION, LAST MODIFIED, and DEPLOYED. Each row represents a custom object related to vehicle management, all of which are 'Custom Object' type and have been deployed.

LABEL	API NAME	TYPE	DESCRIPTION	LAST MODIFIED	DEPLOYED
Vehicle	Vehicle__c	Custom Object		06/09/2026	✓
Vehicle Customer	Vehicle_Customer__c	Custom Object		06/09/2026	✓
Vehicle Dealer	Vehicle_Dealer__c	Custom Object		06/09/2026	✓
Vehicle Order	Vehicle_Order__c	Custom Object		07/09/2026	✓
Vehicle Service Request	Vehicle_Service_Request__c	Custom Object		07/09/2026	✓
Vehicle Test Drive	Vehicle_Test_Drive__c	Custom Object		07/09/2026	✓

Figure 2.1. Salesforce Object Manager showing the custom vehicle management objects created for the project

2.2 Customization of Objects and Fields

The following custom objects form the main data structure of the CRM. The field screenshots included in this documentation are selected evidence from the Salesforce Object Manager rather than a full collection of every setup screen.

2.2.1 Vehicle__c

The Vehicle object stores the vehicle name, model, price, status, stock quantity, and dealer relationship. The available fields shown in the Salesforce configuration include Price (Currency), Status (Picklist), Stock Quantity (Number), Vehicle Dealer (Lookup), Vehicle Model (Picklist), and Vehicle Name.

The screenshot shows the Salesforce Object Manager interface for the 'Vehicle' object. The 'Fields & Relationships' tab is selected, displaying a table of 9 fields. The table has columns for Field Label, Field Name, Data Type, Controlling Field, and Indexed. The fields listed are: Created By, Last Modified By, Owner, Price, Status, Stock Quantity, Vehicle Dealer, Vehicle Model, and Vehicle Name.

FIELD LABEL	FIELD NAME	DATA TYPE	CONTROLLING FIELD	INDEXED
Created By	CreatedById	Lookup(User)		
Last Modified By	LastModifiedById	Lookup(User)		
Owner	OwnerId	Lookup(User,Group)		✓
Price	Price__c	Currency(18, 0)		
Status	Status__c	Picklist		
Stock Quantity	Stock_Quantity__c	Number(18, 0)		
Vehicle Dealer	Vehicle_Dealer__c	Lookup(Vehicle Dealer)		✓
Vehicle Model	Vehicle_Model__c	Picklist		
Vehicle Name	Name	Text(80)		✓

Figure 2.2. Vehicle Fields Relationships

2.2.2 Vehicle_Dealer__c

The Vehicle Dealer object stores dealer name, dealer location, dealer code, phone, and email. The dealer code is maintained as an auto-number field.

The screenshot shows the Salesforce Object Manager interface for the 'Vehicle Dealer' object. The 'Fields & Relationships' tab is selected, displaying a table of 8 fields. The table has columns for Field Label, Field Name, Data Type, Controlling Field, and Indexed. The fields listed are: Created By, Dealer Code, Dealer Location, Email, Last Modified By, Owner, Phone, and Vehicle Dealer Name.

FIELD LABEL	FIELD NAME	DATA TYPE	CONTROLLING FIELD	INDEXED
Created By	CreatedById	Lookup(User)		
Dealer Code	Dealer_Code__c	Auto Number		
Dealer Location	Dealer_Location__c	Text(60)		
Email	Email__c	Email		
Last Modified By	LastModifiedById	Lookup(User)		
Owner	OwnerId	Lookup(User,Group)		✓
Phone	Phone__c	Phone		
Vehicle Dealer Name	Name	Text(80)		✓

Figure 2.3. Vehicle Dealer Fields Relationships

2.2.3 Vehicle_Customer__c

The Vehicle Customer object stores customer name, email, phone, address, and preferred vehicle type. These details are later used by order and test-drive processes.

The screenshot shows the Salesforce Setup interface for the 'Vehicle Customer' object. The left sidebar contains a navigation menu with options like Details, Fields & Relationships, Page Layouts, Lightning Record Pages, Buttons, Links, and Actions, Compact Layouts, Field Sets, Object Limits, Record Types, Related Lookup Filters, Search Layouts, List View Button Layout, Slack Record Layouts, and Restriction Rules. The main content area is titled 'Vehicle Customer' and shows 'Fields & Relationships' with 8 items, sorted by Field Label. A search bar and buttons for 'New', 'Deleted Fields', 'Field Dependencies', and 'Set History Tracking' are at the top. The table below lists the fields:

FIELD LABEL	FIELD NAME	DATA TYPE	CONTROLLING FIELD	INDEXED
Address	Address__c	Text(60)		
Created By	CreatedById	Lookup(User)		
Email	Email__c	Email		
Last Modified By	LastModifiedById	Lookup(User)		
Owner	OwnerId	Lookup(User,Group)		✓
Phone	Phone__c	Phone		
Preferred Vehicle Type	Preferred_Vehicle_Type__c	Picklist		
Vehicle Customer Name	Name	Text(80)		✓

Figure 2.4. Vehicle Customer Fields Relationships

2.2.4 Vehicle_Order__c

The Vehicle Order object contains the order date, status, vehicle lookup, and vehicle customer lookup. The order name is maintained as an auto-number field.

The screenshot shows the Salesforce Setup interface for the 'Vehicle Order' object. The left sidebar contains a navigation menu with options like Details, Fields & Relationships, Page Layouts, Lightning Record Pages, Buttons, Links, and Actions, Compact Layouts, Field Sets, Object Limits, Record Types, Related Lookup Filters, Search Layouts, List View Button Layout, Slack Record Layouts, and Restriction Rules. The main content area is titled 'Vehicle Order' and shows 'Fields & Relationships' with 8 items, sorted by Field Label. A search bar and buttons for 'New', 'Deleted Fields', 'Field Dependencies', and 'Set History Tracking' are at the top. The table below lists the fields:

FIELD LABEL	FIELD NAME	DATA TYPE	CONTROLLING FIELD	INDEXED
Created By	CreatedById	Lookup(User)		
Last Modified By	LastModifiedById	Lookup(User)		
Order Date	Order_Date__c	Date		
Owner	OwnerId	Lookup(User,Group)		✓
Status	Status__c	Picklist		
Vehicle	Vehicle__c	Lookup(Vehicle)		✓
Vehicle Customer	Vehicle_Customer__c	Lookup(Vehicle Customer)		✓
Vehicle Order Name	Name	Auto Number		✓

Figure 2.5. Vehicle Order Fields Relationships

2.2.5 Vehicle_Test_Drive__c

The Vehicle Test Drive object stores status, test-drive date, selected vehicle, and selected customer.

The screenshot shows the Salesforce Object Manager interface for the 'Vehicle Test Drive' object. The left sidebar contains navigation links: Details, Fields & Relationships (selected), Page Layouts, Lightning Record Pages, Buttons, Links, and Actions, Compact Layouts, Field Sets, Object Limits, Record Types, Related Lookup Filters, Search Layouts, List View Button Layout, Slack Record Layouts, and Restriction Rules. The main content area displays the 'Fields & Relationships' section with 8 items, sorted by Field Label. A search bar and buttons for 'New', 'Deleted Fields', 'Field Dependencies', and 'Set History Tracking' are at the top right. The table below lists the fields with their labels, names, data types, controlling fields, and indexed status.

FIELD LABEL	FIELD NAME	DATA TYPE	CONTROLLING FIELD	INDEXED
Created By	CreatedById	Lookup(User)		
Last Modified By	LastModifiedById	Lookup(User)		
Owner	OwnerId	Lookup(User,Group)		✓
Status	Status__c	Picklist		
Test Drive Date	Test_Drive_Date__c	Date		
Vehicle	Vehicle__c	Lookup(Vehicle)		✓
Vehicle Customer	Vehicle_Customer__c	Lookup(Vehicle Customer)		✓
Vehicle Test Drive Name	Name	Text(80)		✓

Figure 2.6. Vehicle Test Drive Relationships

2.2.6 Vehicle_Service_Request__c

The Vehicle Service Request object records issue description, service date, status, vehicle, and customer.

The screenshot shows the Salesforce Object Manager interface for the 'Vehicle Service Request' object. The left sidebar contains navigation links: Details, Fields & Relationships (selected), Page Layouts, Lightning Record Pages, Buttons, Links, and Actions, Compact Layouts, Field Sets, Object Limits, Record Types, Related Lookup Filters, Search Layouts, List View Button Layout, Slack Record Layouts, and Restriction Rules. The main content area displays the 'Fields & Relationships' section with 9 items, sorted by Field Label. A search bar and buttons for 'New', 'Deleted Fields', 'Field Dependencies', and 'Set History Tracking' are at the top right. The table below lists the fields with their labels, names, data types, controlling fields, and indexed status.

FIELD LABEL	FIELD NAME	DATA TYPE	CONTROLLING FIELD	INDEXED
Created By	CreatedById	Lookup(User)		
Issue Description	Issue_Description__c	Text(60)		
Last Modified By	LastModifiedById	Lookup(User)		
Owner	OwnerId	Lookup(User,Group)		✓
Service Date	Service_Date__c	Date		
Status	Status__c	Picklist		
Vehicle	Vehicle__c	Lookup(Vehicle)		✓
Vehicle Customer	Vehicle_Customer__c	Lookup(Vehicle Customer)		✓
Vehicle Service Request Name	Name	Text(80)		✓

Figure 2.7. Vehicle Service Request Relationships

2.3 Validation and Business Logic

The project uses Apex business logic to check vehicle stock during vehicle-order processing. When the selected vehicle has no available stock, the order is prevented and the user receives an appropriate message. This supports accurate stock management and avoids creating an order for an unavailable vehicle.

2.4 Automation – Automatic Dealer Assignment

A Record-Triggered Flow is used for the automatic dealer assignment process. The intended business sequence is to use the customer information associated with an order, read the relevant customer location information, identify a suitable dealer, and associate the dealer with the order. This reduces manual assignment work.

2.5 Automation – Test Drive Reminder

The Test Drive Reminder automation works with the Vehicle Test Drive record. For a scheduled test drive, the related customer information can be used to send a reminder before the appointment. The documented design uses the test-drive date and customer email information for the reminder process.

2.6 Apex Classes and Triggers

Apex is used for business logic that is more suitable for programmatic processing. The implementation includes an order trigger and a trigger handler. The trigger calls the handler, while the handler contains the logic for checking stock and updating vehicle stock when an order is confirmed.

Figure 2.8. VehicleOrderTriggerHandler

Figure 2.9. VehicleOrderTrigger

2.7 Asynchronous Apex

Batch Apex is included to process pending vehicle orders. The batch checks pending orders and confirms an order when the related vehicle has available stock, while also reducing the corresponding stock quantity. Scheduled Apex is used to start the batch process on a schedule.

Figure 2.10. VehicleOrderBatch

Figure 2.11. VehicleOrderBatchScheduler

2.8 Workflow Rules, Process Builder and Approval Process

The current evidence supplied for this project focuses on Record-Triggered Flows and Apex automation. No separate Workflow Rule, Process Builder, or Approval Process configuration is evidenced in the supplied project screenshots. These components should therefore not be presented as implemented features unless they were created separately in the Salesforce org.

Figure 2.12. Auto Assign Dealer

Figure 2.13. Test Drive Reminder

Chapter 3

Phase 3: UI/UX Development & Customization

3.1 Lightning App Setup through App Manager

The Salesforce application is designed to provide a central workspace for the automotive CRM. The application brings the custom business objects and Salesforce functionality together so that users can work with vehicles, customers, dealers, orders, test drives, and service requests.

3.2 Page Layouts and Dynamic Forms

Page layouts are used to control the fields and actions displayed to users on records. The object configuration includes dedicated page-layout support for the custom objects. Dynamic Forms may be used where required to control field visibility and presentation; no separate Dynamic Forms screenshot is included in the supplied evidence.

3.3 User Management

The Salesforce user and security model is based on profiles, roles, permission sets, and sharing settings. The System Administrator profile can be used during development and configuration, while additional access can be provided through suitable permission settings.

3.4 Reports and Dashboards

Reports and dashboards provide a visual summary of CRM information. Suitable business views include vehicle stock, order status, pending orders, confirmed orders, test-drive schedules, and service-request status.

Recommended working screenshot: include the actual Salesforce dashboard or report page here if it is available in the remaining project screenshots.

3.5 Lightning Pages

Lightning Pages provide the user interface for the Salesforce application. The page design can bring important records and business information into a single workspace for easier navigation.

3.6 Lightning Web Components

No custom Lightning Web Component is evidenced in the current implementation. The project mainly uses standard Lightning configuration, Flows, and Apex components.

Figure 3.1. App Details Branding

Figure 3.2. Navigation Items

Chapter 4

Phase 4: Data Migration, Testing & Security

4.1 Data Loading Process

The project data can be loaded using Salesforce data-management tools such as the Data Import Wizard or Data Loader. The main data categories are vehicle, dealer, customer, order, test-drive, and service-request records. Lookup relationships should be preserved so that imported records remain correctly connected.

4.2 Field History Tracking

Field History Tracking can be enabled for important fields where changes need to be reviewed. It provides a history of selected record changes and supports better monitoring of business information. A dedicated configuration screenshot is not included in the selected evidence.

4.3 Duplicate Rules and Matching Rules

Duplicate Rules and Matching Rules can be used to help identify possible duplicate customer or business records. These features are useful for maintaining clean and consistent CRM data. No separate duplicate-rule screenshot is included in the selected evidence.

4.4 Profiles, Roles, Role Hierarchy, Permission Sets and Sharing Rules

The security design includes:

- Profiles for baseline object and system permissions.
- Roles and Role Hierarchy for record visibility.
- Permission Sets for additional access where required.
- Sharing Rules for controlled record sharing.

4.5 Testing Approach

Testing was planned around the main Salesforce features and business processes. Tests were performed or should be performed using realistic sample records so that both the input and resulting output can be checked.

ID	Feature	Input / Action	Expected Result
TC01	Vehicle Creation	Enter valid vehicle details.	Vehicle record is created successfully.
TC02	Customer Creation	Enter valid customer details.	Customer record is created successfully.
TC03	Dealer Creation	Enter valid dealer details.	Dealer record is created with dealer information.
TC04	Vehicle Order	Select a customer and available vehicle.	Order is created with related records.
TC05	Stock Validation	Attempt an order for a vehicle with no stock.	Order is prevented and an appropriate message is displayed.
TC06	Stock Update	Confirm a valid order.	Vehicle stock is reduced according to the Apex logic.
TC07	Dealer Assignment	Create an order with customer information.	Dealer assignment automation updates the order as configured.
TC08	Test Drive	Create a scheduled test-drive record.	Test-drive record is stored with customer and vehicle.
TC09	Reminder Automation	Use a scheduled test drive with the required date.	Reminder process runs according to the configured automation.
TC10	Service Request	Create a service request.	Service request is stored with customer and vehicle.
TC11	Batch Apex	Process pending orders with available stock.	Suitable pending orders are confirmed and stock is updated.
TC12	Reports / Dashboard	Open the configured report or dashboard.	Relevant CRM information is displayed.

4.6 Project Working Process and Output Evidence

This section presents the working process of the WhatNext Vision Motors Salesforce CRM from record creation to automated processing. The screenshots should be arranged in the same order as the business process so that the complete working of the project can be understood easily.

4.6.1 Step 1 – Create Vehicle Record

A vehicle record is created first with the required vehicle name, model, price, status, stock quantity, and dealer information. This record provides the vehicle details that are used in the order and test-drive processes.

Figure 4.1. Vehicle Record Creation

4.6.2 Step 2 – Create Dealer Record

The dealer record is created with dealer name, location, phone, email, and dealer code. Dealer information is later used when a suitable dealer is assigned to a vehicle order.

Figure 4.2. Vehicle Dealer Creation

4.6.3 Step 3 – Create Customer Record

A customer record is created with the customer's name, address, email, phone number, and preferred vehicle type. The customer record is then available for vehicle orders, test drives, and service requests.

Figure 4.3. Vehicle Customer Creation

4.6.4 Step 4 – Create Vehicle Order

A vehicle order is created by selecting the customer and the required vehicle. The order date and order status are maintained in the Vehicle Order record.

Figure 4.4. Vehicle Order Creation

4.6.5 Step 5 – Successful Order and Stock Update

When the selected vehicle has available stock, the order can be processed successfully. The Apex trigger and trigger handler validate the stock and update the vehicle stock when the order is confirmed.

Figure 4.5. Order and Stock updated

4.6.6 Step 6 – Out-of-Stock Validation

An order is also tested when the selected vehicle has zero available stock. The Apex logic checks the stock quantity and prevents the order when the vehicle is unavailable.

Figure 4.6. Out of Stock

4.6.7 Step 7 – Automatic Dealer Assignment

After an order is created with customer information, the Record-Triggered Flow processes the customer details and assigns a suitable dealer to the order according to the configured business logic.

Figure 4.7. Vehicle Order

Figure 4.8. Vehicle Order showing the automatically assigned dealer

4.6.8 Step 8 – Schedule a Test Drive

A test-drive record is created by selecting the customer and vehicle and entering the scheduled test-drive date. The record stores the appointment details for future processing.

Figure 4.9. Schedule a Test Drive

4.6.9 Step 9 – Test Drive Reminder

The Test Drive Reminder Flow uses the scheduled test-drive information and customer email information to send a reminder before the appointment.

Figure 4.10. Vehicle Test Drive

Figure 4.11. Reminder Test Drive Vehicle

4.6.10 Step 10 – Create Service Request

A service request is created when a customer reports a vehicle issue. The record contains the issue description, service date, status, vehicle, and customer.

Figure 4.12. Service Request for the Vehicle

4.6.11 Step 11 – Process Pending Orders Using Batch Apex

Pending orders can be processed using Batch Apex when stock becomes available. The batch checks pending orders, confirms suitable orders, and updates vehicle stock according to the implemented logic.

Figure 4.13. Vehicle Order

Figure 4.14. Vehicle Update After Vehicle Order

4.6.12 Step 12 – Monitor Apex and Scheduled Processing

The Salesforce monitoring screens can be used to verify that the Apex batch and scheduled processing have executed. These screens provide supporting evidence for the asynchronous processing implemented in the project.

Figure 4.15. Vehicle Order when Vehicle is out of stock

Figure 4.16. Anonymous Window to Schedule the Batch Job

The screenshot shows the Salesforce Setup page for 'Developer Edition'. The left sidebar contains navigation links: Setup, Home, Object Manager, and a search bar. The main content area is titled 'Scheduled Jobs' and displays a table of all scheduled jobs. A yellow banner indicates that 1% of the scheduled jobs limit (100 total) is currently used. The table lists jobs with columns for Action, Job Name, Submitted By, Submitted, Started, Next Scheduled Run, Type, and Cron Trigger ID.

Action	Job Name	Submitted By	Submitted	Started	Next Scheduled Run	Type	Cron Trigger ID
Manage Del Pause Job	Daily Vehicle Order Processing	Varsha_Kelam	9/11/2026, 6:30 AM		9/11/2026, 12:00 PM	Scheduled Apex	08ejv0000019xGE
Del	Metalytics Data Loader Job for Org : 00DJv000002xPUI	User_Integration	9/7/2026, 5:11 AM	9/11/2026, 4:32 AM	9/12/2026, 4:32 AM	Autonomous Data Loader Job	08ejv0000019tZx
	Program Milestone Computation Cron Job	Process, Automated	9/7/2026, 5:11 AM	9/10/2026, 11:59 PM	9/11/2026, 6:59 AM	Program Milestone Computation Cron Job	08ejv0000019tZv
	Program Status Update Cron Job	Process, Automated	9/7/2026, 5:11 AM	9/11/2026, 5:00 PM	9/11/2026, 8:00 PM	Program Status Update Cron Job	08ejv0000019tZw

Figure 4.17. Job Scheduled as daily vehicle order processing

4.6.13 Step 13 – Final Project Working Flow

The complete project flow connects the major Salesforce features into one business process. Vehicle, dealer, and customer records are created first. Orders and test drives are then created using the related records. Order processing validates stock and can assign a dealer automatically. Test-drive reminders are generated by automation, while service requests are maintained separately. Pending orders can be processed through Batch Apex when stock becomes available.

4.7 Apex Test Classes

Apex test classes should verify the order trigger, trigger handler, stock validation, stock reduction, and batch processing. If test classes were created in the Salesforce org, their execution/result screenshot should be added to this section. The current selected screenshot set does not include a confirmed Apex test-class execution screen, so none is represented as completed evidence here.

Chapter 5

Phase 5: Deployment, Documentation & Maintenance

5.1 Deployment Strategy

Salesforce metadata can be moved between environments using Change Sets or another suitable deployment method. The deployment package should contain the required custom objects, fields, relationships, Lightning components, flows, Apex classes, triggers, batch/scheduled components, profiles or permission-related components, reports, dashboards, and their dependencies.

5.2 System Maintenance

The CRM can be maintained through regular review of user access, automation, vehicle stock, pending orders, reports, dashboards, scheduled jobs, batch processing, and Apex execution. Configuration can be updated when the business process changes.

5.3 Monitoring

Salesforce monitoring tools can be used to review Flow execution, Apex errors, scheduled jobs, batch results, and changes to important records. Regular monitoring helps identify issues early and keeps the application reliable.

5.4 Troubleshooting Approach

A simple troubleshooting approach is:

1. Identify the business process where the issue occurred.
2. Check the affected record and its field values.
3. Verify object relationships and required information.
4. Review Flow execution details where applicable.

5. Review Apex logs or processing results for programmatic logic.
6. Check scheduled and batch job status when asynchronous processing is involved.
7. Verify user permissions and access.
8. Correct the configuration or code and test the process again.

Conclusion

The WhatNext Vision Motors Salesforce CRM project provides a structured way to manage important automotive activities in one Salesforce environment. The custom objects and lookup relationships create a connected data model for vehicles, dealers, customers, orders, test drives, and service requests.

The project also demonstrates the use of Salesforce automation and Apex development. Stock validation, stock updates, dealer assignment, test-drive communication, and pending-order processing help reduce repetitive work and support more consistent business processing. The Lightning interface, reports, and dashboards provide users with a practical way to view and work with CRM information.

Overall, the project meets the main goal of creating a student-level Salesforce CRM solution for an automotive business while providing a good foundation for further improvements.
